Python static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your PYTHON code

All rules 216 | Vulnerability 29 | Bug 55 | Security Hotspot 31 | Code Smell 101

Tags

Search by name...

Unread "private" attributes should be removed
Code Smell

Cognitive Complexity of functions should not be too high
Code Smell

The first argument to class methods should follow the naming convention
Code Smell

Method overrides should not change contracts
Code Smell

Wildcard imports should not be used
Code Smell

String literals should not be duplicated
Code Smell

Functions and methods should not be empty
Code Smell

Server-side requests should not be vulnerable to forging attacks
Vulnerability

Non-empty statements should change control flow or have at least one side-effect
Bug

Replacement strings should reference existing regular expression groups
Bug

Alternation in regular expressions should not contain empty alternatives
Bug

Unicode Grapheme Clusters should be avoided inside regex character classes

Server hostnames should be verified during SSL/TLS connections

Analyze your code

Vulnerability | Critical | cwe privacy owasp ssl

To establish a SSL/TLS connection not vulnerable to man-in-the-middle attacks, it's essential to make sure the server presents the right certificate.

The certificate's hostname-specific data should match the server hostname.

It's not recommended to re-invent the wheel by implementing custom hostname verification.

TLS/SSL libraries provide built-in hostname verification functions that should be used.

Noncompliant Code Example

Python ssl standard library:

```
import ssl

ctx = ssl._create_unverified_context() # Noncompliant: by de
ctx = ssl._create_stdlib_context() # Noncompliant: by defaul

ctx = ssl.create_default_context()
ctx.check_hostname = False # Noncompliant

ctx = ssl._create_default_https_context()
ctx.check_hostname = False # Noncompliant
```

Compliant Solution

Python ssl standard library:

```
import ssl

ctx = ssl._create_unverified_context()
ctx.check_hostname = True # Compliant

ctx = ssl._create_stdlib_context()
ctx.check_hostname = True # Compliant

ctx = ssl.create_default_context() # Compliant: by default h
ctx = ssl._create_default_https_context() # Compliant: by de
```

Bug

Regex alternatives should not be redundant

Bug

Alternatives in regular expressions should be grouped when used with anchors

Bug

New objects should not be created only to check their identity

Bug

- MITRE, CWE-297 - Improper Validation of Certificate with Host Mismatch
