## 29.4. \_\_main\_\_ — Top-level script environment

'\_\_main\_\_' is the name of the scope in which top-level code executes. A module's \_\_name\_\_ is set equal to '\_\_main\_\_' when read from standard input, a script, or from an interactive prompt.

A module can discover whether or not it is running in the main scope by checking its own \_\_name\_\_, which allows a common idiom for conditionally executing code in a module when it is run as a script or with python -m but not when it is imported:

```
if __name__ == "__main__":
# execute only if run as a script
main()
```

For a package, the same effect can be achieved by including a \_\_main\_\_.py module, the contents of which will be executed when the module is run with -m.
